Reset the MySQL/MariaDB Root Password

By default, the MySQL/MariaDB installation that ships with XAMPP has an empty root password. This is a serious security risk, especially if you plan to use XAMPP in production scenarios.

To change the MySQL/MariaDB root password, follow these steps:

- 1. Launch the stack manager by double-clicking the XAMPP icon in the mounted disk image.
- 2. Ensure that Apache and MySQL services are running in the "Services" tab of the stack manager (or start them as needed).
- 3. Open a new terminal from the "General" tab of the stack manager.
- 4. Use the *mysqladmin* command-line utility to alter the MySQL/MariaDB password, using the following syntax:

```
mysqladmin --user=root password "newpassword"
```

The *mysqladmin* command-line utility is located within the XAMPP /opt/lampp/bin/ directory.

For example, to change the MySQL/MariaDB root password from its default empty value to the password *gue55me*, you would execute:

```
/opt/lampp/bin/mysqladmin --user=root password "gue55me"

ot@debian:~# /opt/lampp/bin/mysqladmin --user=root password "gue55me"

root@debian:~# ■
```

Or, if a password has already been previously set and you'd like to change it to a new one, you can use the following syntax:

```
mysqladmin --user=root --password=oldpassword password "newpassword"
```

For example, to change the root password from 12345 to gue55me, you would execute:

```
/opt/lampp/bin/mysqladmin --user=root --password=12345 password "gue55me"
```

5. Test that your password change has been accepted, by attempting to connect to the MySQL/MariaDB server using the *mysql* command-line client in the same directory. For example, you could use the command below to connect to the server and return the results of a calculation:

/opt/lampp/bin/mysql --user=root --password=gue55me -e "SELECT 1+1"

```
root@debian:~# /opt/lampp/bin/mysql --user=root --password=gue55me -e "SELECT 1+ 1"
+----+
| 1+1 |
+----+
| 2 |
+----+
root@debian:~#
```
